

## Burndown

### **Explanation:**

The burndown chart for sprint 4 is characterized by a steep decline during the end of the sprint. The larger decline at the end was because all the members had midterms and assignments due in the first week, so they could not work on the C01 project. All the above reasons are the reason as to why the tasks are completed around the end of the sprint.

### **Velocity:**

Our velocity for sprint 4 was 40, as compared to 39 during sprint 3. The velocity increased since sprint 1 was mostly about the initial stages of the event page and the completion of profile page, whereas during sprint 2, our tasks were more related to the main feature such as the item page and also completing the other main feature from sprint 2 which was the event planning feature, and also some bug fixes from sprint 2 too. We also had a big feature which was the SMS feature which took some time. This sprint also contained unfinished tasks from sprint 3 and some improvements that we decided to carry forward from sprint 3. Furthermore, our members now have more knowledge with react and node than sprint 1 and 2 so the members decided to tackle more challenging tasks.
